Descrição

We have technology for Green Modular Buildings designed to be sustainable and to interact with the surrounding environment acting like a living organism that reacts to daily and annual variations of the solar radiation, optimizing solar energy and daylight. This technology comes with a mobile interface, which enables the user to configure it's movements through it. The user has the option to be in control. We have a patent for our "Sunflower System". Our technology that allows Modules to rotate 180o (either the entire structure or just the roof). The rotation of the building also allows new concepts of housing, creating different indoor and outdoor spaces during the day. For instance, in the morning, the kitchen can be smaller, as 21st century families' daily routine seldom allows everyone to have breakfast together; by night, it can fuse with the living room, allowing the family to spend time.

Tipo de Organização

Empresa

País

Portugal

Áreas de Actuação

Arquitetura de interiores

Iluminação, electricidade, domótica, robótica, novas tecnologias e informática

Cimentos, argamassas, pré-fabricação e construção industrializada

Oferta e Pedido

Tecnologia "Sunflower System"

Feedback and capital to help us enter international markets. Connections as for technological synergies and commercialization of our product. An investor with experience in the market of green modular construction would be

extremely valuable to us, just as we can be of high value towards that investor.
